1.	Which of the expressions below select the last character in the string "Grail"?	1/1 point
	<pre> ✓ "Grail"[-1]</pre>	
	 ✓ Correct This expression selects the last character. 	
	■ # C	
	✓ "Grail"[4]	
	 ✓ Correct This expression selects the last character. 	
	This expression selects the last enalacten	
	<pre>"Grail"[len("Grail")]</pre>	
	<pre>"Grail"[-4])]</pre>	
2.	Which of the string slices below selects the string "Sir" from the string "Sir Robin"?	1/1 point
	☐ "Sir Robin"[1 : 4]	
	✓ "Sir Robin"[: 3]	
	○ Correct This expression returns the string "Sir".	
	This expression returns the string bit.	
	☐ "Sir Robin"[1 : 3]	
	<pre> ✓ "Sir Robin"[0 : 3]</pre>	
	⊘ Correct	
	This expression returns the string "Sir".	
3.	Which one of the operators below can not be used with strings in Python?	1/1 point
	+ (addition)	
	* (multiplication)	
	— (subtraction)	
	in (membership)	
	String subtraction in not defined in Python.	
4.	What does the expression a_str.find(sub) do when the string sub is not a substring of the string a_str?	1/1 point
	Return the value −1.	
	Return the value 0.	
	Return the value None.	
	Raise an error.	
	○ Raise an error.⊘ Correct	
5.		1/1 point
5.	⊘ Correct	1/1 point
5.	○ Correct Which of the string format expressions below return the string "abracadabra"?	1/1 point
5.	<pre></pre>	1/1 point
5.	✓ Correct Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra")	1/1 point
5.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") Correct This example returns "abracadabra".	1/1 point
5.	<pre>Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{2}{1}{0}".format("abra", "cad")</pre>	1/1 point
5.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") Correct This example returns "abracadabra".	1/1 point
5.	<pre>Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") **Correct This example returns "abracadabra". "{2}{1}{0}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") **Correct</pre> Correct **Correct **Correct **Correct **Correct **Correct	1/1 point
5.	<pre> ② Correct Which of the string format expressions below return the string "abracadabra"? □ "{1}{2}{1}".format("abra", "cad", "abra") ☑ "{0}{1}{0}".format("abra", "cad", "abra") ② Correct This example returns "abracadabra". □ "{2}{1}{0}".format("abra", "cad") ☑ "{0}{1}{2}".format("abra", "cad", "abra") □ "{0}{1}{2}".format("abra", "cad", "abra") </pre>	1/1 point
5.	<pre>Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") **Correct This example returns "abracadabra". "{2}{1}{0}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") **Correct</pre> Correct **Correct **Correct **Correct **Correct **Correct	1/1 point
5.	<pre>Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") **Correct This example returns "abracadabra". "{2}{1}{0}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") **Correct</pre> Correct **Correct **Correct **Correct **Correct **Correct	1/1 point
	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{2}{1}{0}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") Correct This example returns "abracadabra". Write a function count_vowels (word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in	
	<pre>Which of the string format expressions below return the string "abracadabra"? 	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{0}{1}{0}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") Correct This example returns "abracadabra". Write a function count_vowels (word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: print(count_vowels("aaassseefffgggiiijjjoookkkuuuu"))	
	Which of the string format expressions below return the string "abracadabra"?	
	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{0}{1}{0}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") Correct This example returns "abracadabra". Write a function count_vowels (word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: print(count_vowels("aaassseefffgggiiijjjoookkkuuuu"))	
	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{0}{1}{0}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") Correct This example returns "abracadabra". Write a function count_vowels (word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: print(count_vowels("aaassseefffgggiiijjjoookkkuuuu"))	
	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{0}{1}{0}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") Correct This example returns "abracadabra". Write a function count_vowels (word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: print(count_vowels("aaassseefffgggiiijjjoookkkuuuu"))	
	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") Correct This example returns "abracadabra". Write a function count_vowels(word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: 1	
	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "forrect This example returns "abracadabra". Ocrrect This example returns "abracadabra". Write a function count_vowels(word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: 1 print(count_vowels("aaassseefffgggiiijjjookkkuuuu")) 2 print(count_vowels("aovvououcvicIIoveeOIcloeuvvauouuvciOIsle")) The first statement should print 13 in the console. Enter the second number printed in the console in the box	
	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") Ocorrect This example returns "abracadabra". Write a function count_vowels(word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: 1 print(count_vowels("aaassseefffgggiiijjjoookkkuuuu")) 2 print(count_vowels("aovvououcvicIIoveeOIcloeuvvauouuvcioIsle")) The first statement should print 13 in the console. Enter the second number printed in the console in the box below.	
	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") Ocorrect This example returns "abracadabra". Write a function count_vowels(word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: 1 print(count_vowels("aaassseefffgggiiijjjoookkkuuuu")) 2 print(count_vowels("aovvououcvicIIoveeOIcloeuvvauouuvcioIsle")) The first statement should print 13 in the console. Enter the second number printed in the console in the box below.	
	<pre>Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") **Correct** This example returns "abracadabra". "{2}{1}{0}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") **Correct** This example returns "abracadabra". Write a function count_vowels(word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, runces of a letter in a string. After you have implemented count_vowels, runces of a letter in a string. 1</pre>	
6.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") Correct This example returns "abracadabra". Write a function count_vowels(word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in astring. After you have implemented count_vowels, run the following two statements: 1 print(count_vowels("aoassseefffgggiiijjjookkkuuuu")) 2 print(count_vowels("aoassseefffgggiiijjjookkkuuuu")) 2 print(count_vowels("aovvououcviciloveeolcloeuvvauouuvciolsle")) The first statement should print 13 in the console. Enter the second number printed in the console in the box below. 17 Correct	1/1 point
6.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") "{2}{1}{0}".format("abra", "cad") "{2}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "foly(1){2}".format("abra", "cad", "abra") Ocorrect This example returns "abracadabra". Write a function count_vowels(word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: 1 print(count_vowels("aaassseefffgggiiijjjoookkkuuuu")) 2 print(count_vowels("aaossseefffgggiiijjjoookkkuuuu")) 2 print(count_vowels("aovvou0ucvicIIoveeOIcloeuvvauouuvcioIsle")) The first statement should print 13 in the console. Enter the second number printed in the console in the box below. 17 Ocorrect Write a function demystify(11_string) that takes a string composed of the characters "1" and "1"	
6.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") "{2}{1}{0}".format("abra", "cad", "abra") "{2}{1}{2}".format("abra", "cad", "abra") "{3}".format("abra", "cad", "abra") "{4}{1}{2}".format("abra", "cad", "abra") "6) Correct This example returns "abracadabra". Write a function count_vowels(word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of aletter in a string. After you have implemented count_vowels, run the following two statements: 1	1/1 point
6.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") **Correct This example returns "abracadabra". "{2}{1}{0}".format("abra", "cad", "abra") **Correct This example returns "abracadabra". Write a function count_vowels (word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of counterces of a letter in a string. After you have implemented count_vowels, run the following two statements: 1	1/1 point
6.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") "{2}{1}{0}".format("abra", "cad", "abra") "{2}{1}{2}".format("abra", "cad", "abra") "{3}".format("abra", "cad", "abra") "{4}{1}{2}".format("abra", "cad", "abra") "6) Correct This example returns "abracadabra". Write a function count_vowels(word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of aletter in a string. After you have implemented count_vowels, run the following two statements: 1	1/1 point
6.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") **Correct** This example returns "abracadabra". "{2}{1}{0}".format("abra", "cad", "abra") **Correct** This example returns "abracadabra". Write a function count_vowels (word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: 1	1/1 point
6.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") **Correct** This example returns "abracadabra". "{2}{1}{0}".format("abra", "cad", "abra") **Correct** This example returns "abracadabra". Write a function count_vowels (word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: 1	1/1 point
6.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") **Correct** This example returns "abracadabra". "{2}{1}{0}".format("abra", "cad", "abra") **Correct** This example returns "abracadabra". Write a function count_vowels (word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: 1	1/1 point
6.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") "correct This example returns "abracadabra". "{2}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") **Correct This example returns "abracadabra". Write a function count_vowels (word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: 1	1/1 point
6.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") Correct This example returns "abracadabra". "{2}{1}{0}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") Correct This example returns "abracadabra". Write a function count_vovels(word) that takes the string word as input and returns the number of occurrences of lowercase wowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vovels, run the following the attements: 1	1/1 point
6.	Which of the string format expressions below return the string "abracadabra"? "{1}{2}{1}".format("abra", "cad", "abra") "{0}{1}{0}".format("abra", "cad", "abra") "correct This example returns "abracadabra". "{2}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad") "{0}{1}{2}".format("abra", "cad", "abra") **Correct This example returns "abracadabra". Write a function count_vowels (word) that takes the string word as input and returns the number of occurrences of lowercase vowels (i.e. the lowercase letters "aeiou") in word. Hint: Python has a built-in string method that can count the number of occurrences of a letter in a string. After you have implemented count_vowels, run the following two statements: 1	1/1 point
